

# Chapter 3 - Describing, Explaining, and Comparing Data

01/25/2023  
 (Revisited)  
 On 01/30/2023

Summarize sample and/or population values using measures of center, variability, and other quantities.

## Measure of Center

Def: Sample mean  $\bar{x} = \frac{\sum_{i=1}^n x_i}{n} = \frac{x_1 + x_2 + \dots + x_n}{n}$

$\bar{x}$  measures the "balance point" of the sample  $x_1, x_2, \dots, x_n$ .

Ex:  $x$  = height (inches) of class of students

(last time)  $n = 22$

$$\sum_{i=1}^{22} x_i = x_1 + \dots + x_{22} = 1542$$

$$\bar{x} = \frac{1542}{22} = 70.09 \text{ inches}$$

or about 5 ft 10 inches (5' 10")

Def: Sample median

$\tilde{x} = \begin{cases} \text{single middle ordered value, if } n \text{ is odd} \\ \text{mean of the two middle ordered values, if } n \text{ is even} \end{cases}$

Ex: (continued)

$n=22$

Find  $\tilde{x}$

$$\tilde{x} = \frac{70+70}{2} = 70 \text{ inches}$$

If  $x_{\max} = 75$  is removed, then  $\tilde{x} = 70$ .

$\underline{64} \quad \underline{66} \dots \quad \underline{70} : \underline{70} \dots \underline{75} \quad \underline{75}$   
 ↑ 11<sup>th</sup> ordered position  
 ↓ 12<sup>th</sup> ordered position

Remark:  $\bar{x}$  is highly affected by outliers whereas  $\tilde{x}$  is relatively unaffected by outliers.

Ex: (follow on) Remove  $x_{\max} = 75$  and replace it with 107 inches. ( $n=22$ )

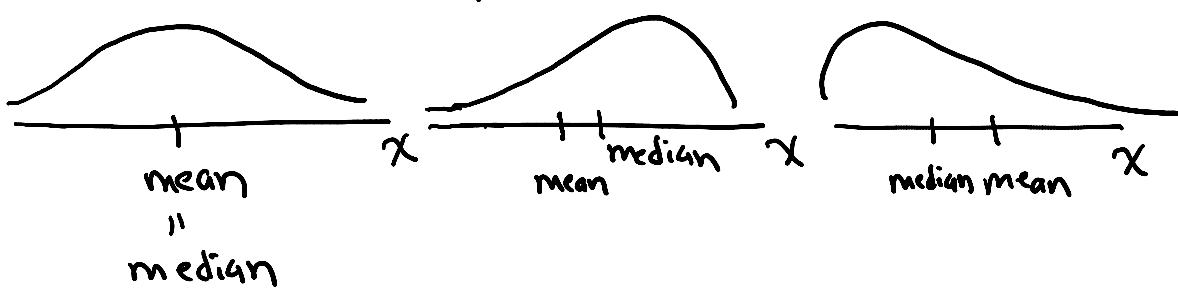

$$\bar{x} = 71.54$$

$$\tilde{x} = 70$$

↑  
"balance point"

Notation: population mean =  $\mu$  ← "mu"  
 population median =  $\tilde{\mu}$

### Examples of Histogram Shapes

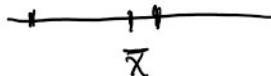

## Measures of Variability

Def: Sample Range =  $x_{\max} - x_{\min}$

Def:  $i^{\text{th}}$  deviation from sample mean is

$$x_i - \bar{x}, i=1,2,\dots,n$$

Remark:  $\sum_{i=1}^n (x_i - \bar{x}) = 0$  (Sum of all deviations is zero)

Def:

sample variance  $s^2 = \frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n-1}$

"Average" squared deviation from the Sample mean

Def: sample standard deviation

$$s = \sqrt{s^2}$$

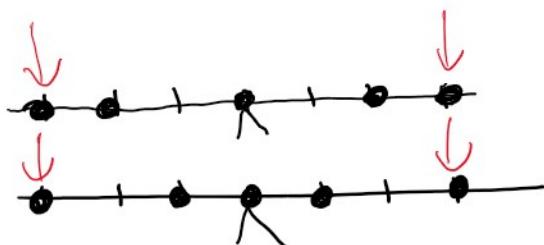

"Typical" distance an  $x$ -value is from the sample mean.

Ex:

$$n=5$$
$$s=0$$

1.)

$$s_1 > s_2$$

2.)

Ex:  $x = \text{height (inches)}$

$$n=22 \quad \bar{x} = 70.09$$

| $i$ | $x_i$ | $\frac{x_i - \bar{x}}{6.09}$ | $\frac{(x_i - \bar{x})^2}{\approx 37.0992}$   | $\frac{x_i^2}{(64)^2}$                    |
|-----|-------|------------------------------|---|---|
| 1   | 64    | -6.09                        | $\approx 37.0992$                             | $\frac{64^2}{(64)^2}$                     |
| ⋮   | ⋮     | ⋮                            | ⋮   | ⋮   |
| 22  | 75    | <u>4.90</u>                  | <u><math>\approx 24.0992</math></u>           | <u><math>\frac{(75)^2}{108278}</math></u> |
|     |       | 0                            | <u><math>\frac{197.8181}{197.8181}</math></u> |   |

$$S^2 = \frac{197.8181}{22-1} = 9.4199 \text{ inches}^2$$

$$S = \sqrt{S^2} = 3.0692 \text{ inches}$$

Interpretation of  $S$ ?

Computational formula for  $S^2$ :

$$S^2 = \frac{\sum_{i=1}^n x_i^2 - \frac{(\sum_{i=1}^n x_i)^2}{n}}{n-1}$$

$$\text{Ex: } S^2 = \frac{108278 - \frac{(1542)^2}{22}}{22-1}$$

Notation: Population Variance =  $\sigma^2$  "sigma squared"  
 Population standard deviation =  $\sigma$  "sigma"

### Sample Quartiles

01/30/2023  
(NEW)

First, order the  $x$ -values from smallest to largest.

Def: lower quartile = median of the lower half  
of the data

$Q_1$   upper quartile = median of the upper half of the data  
 $Q_3$

Def : Interquartile Range (IQR)

$$IQR = Q_3 - Q_1$$

= upper quartile - lower quartile

= difference between upper and lower quartiles

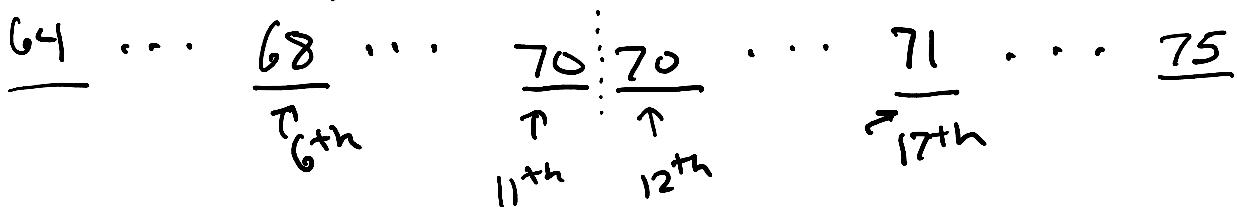

Ex :  $x$  = height (continued)

$$n=22$$

$$Q_1 = 68$$

$$Q_2 = 70$$

$$Q_3 = 71$$

$$IQR = Q_3 - Q_1 = 3 \text{ inches}$$

$$= 71 - 68$$

Five number summary of a sample and boxplot are useful summaries of the sample data.

Def : A skeletal boxplot is a visual display of data based on the five numbers below:

$\min, Q_1, \text{median}, Q_3, \max$

Ex:  $x = \text{height}$   
 $n = 22$

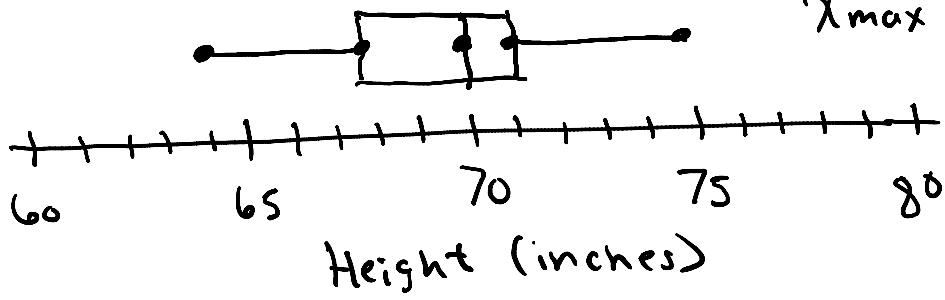

$$x_{\min} = 64$$

$$Q_1 = 68$$

$$\tilde{x} = \text{median} = 70$$

$$Q_3 = 71$$

$$x_{\max} = 75$$

01/30/2023

Def: Percentiles, denoted by  $P_1, P_2, \dots, P_{100}$

divide data into 100 groups with  
about 1% of the values in each group.
